**Abstract of JP62049528**

**PURPOSE:**To improve the operability with a help guidance system by giving the definite explanation to the contents requested by a user. **CONSTITUTION:**A guidance request code supplied from an input part 1 is applied to an internal storage part 3 and the guide information is displayed at an output part 2 after the guide information and a correspondence table are read out of an external storage part 4. If an indefinite part is included in each word of the explanation, a user points out the area where the guidance is needed. Thus the position information is delivered to a guide control function part. Then the guidance position is detected on a picture and the corresponding item is detected by means of the correspondence table. Thus the guidance explanation is displayed.
